

The principle of jet propulsion and its related manner of directional control in Turbocraft boats is an appreciable departure from the long accepted conventional propeller and rudder. Many advantages of this innovational concept become immediately apparent, but none of them miraculously transforms a small boat into an ocean going vessel. A sixteen foot Turbocraft, even though your faith in its capabilities soon becomes boundless, is just as susceptible to heavy seas and rough waters as any other small craft. Discretion is the better part of valor, even as we wish you many happy hours on the water.

"It takes a lot of experience with any given boat to learn all her whims and traits--to know her strong points and use them wisely to overcome the weak ones. But boats, like individuals, do respond to understanding treatment."
